Subject: Sirenusa Upper J

Chris,

Pursuant to our conversation of this afternoon, I am letting you know of my intention to enter Sirenusa Upper J, the unit I own jointly with my wife Susan McLean, from Friday, April 24th through Friday, May 1st in order to attempt to restore our residence there to its former state prior to the incident of contamination that occurred last month. I understand that the most recent measurements of methylbromide, while not formally QA'd and QC'd by the EPA, represent a level of this toxin which is below the RfC of 0.005mg/m3 as published in US EPA Air Toxics Publication at <http://www.epa.gov/airtoxics/hlthef/methylbr.html>. The most recent prior measurement (<80ppb) is also been below the OSHA PEL and ACGIH TLV regulatory thresholds listed in that same document. I hold an MPH degree from the University of Cincinnati and my wife holds an MSN from the University of Kentucky. As informed and current health professionals, we assume any and all risk associated with entering and residing in the unit for the one week period stated. We further assert that no other person or guest shall reside in the unit until a letter of clearance or occupancy is received from the appropriate Federal, state or local agency that has jurisdiction. We expect that government officials, representatives of Sea Glass Vacations and cleaning personnel may enter the unit as needed to perform work for short periods of time in the interim.

Please reply that you have received this communication by email. I trust that you will make the appropriate contacts with local authorities to ensure that our access to the unit is not impeded unnecessarily.

Regards,

Erik Risemberg, MS, MPH
(513) 403-2756

Susan McLean, MSN
